

The Sydney Tar Ponds Agency has released a tender for the construction of a protective cap over treated tar ponds sediment. It's the third step in a series of projects leading to the future development of the remediated site. Construction of the multi-layer protective cap will begin in the fall, and is scheduled for completion in summer, 2013. It will include a grading/bedding layer, a geosynthetic clay layer, a geocomposit drainage layer, protective fill, topsoil and hydro seed. The cap is designed to direct rain and groundwater into an engineered channel that will also carry brook water to the mouth of Sydney Harbour. The tender closes Aug. 10. More than 70 per cent of the south pond, located between Prince Street and the Ferry Street Bridge, has been solidified and stabilized. Treatment of the entire pond is expected to be completed in August. It will be followed by the construction of a channel to allow brook water and groundwater to flow through the site and into the harbour. In January 2007, the government of Canada and province of Nova Scotia committed \$400 million to ensure the Tar Ponds and Coke Ovens cleanup is completed by 2014.
